Question 1: `git add` is the one who moves your file to staging area. When you say `git add report.md` it will move the `report.md` from directory to staging area. While `git commit` moves the file from staging area into the local repository. It also needs message— let's say `git commit -m "assignment"`, the file will move to local repository along with this commit.

Question 2: Deleting a file on GitHub will not automatically delete the file from your local computer. I still did not finished the datacamp assignment about git, so when I did the searching(google ai), it says that you need a command `git pull` to update your local repository and reflect the deletion from your github.
